

Track and locate any key any time to improve operations and customer experiences.

goIDit helps your dealership run more efficiently!

goIDit provides indoor location services to accurately determine a users location. As users move around the dealership the app updates their locations.

Tracker Beacons can be configured and are used to track and update the location of vehicles on a lot. The Tracker is easy to associate with a vehicle and its location is updated using the GPS from a device running the app.

If you spend time and money locating and replacing lost keys we have a solution for you.

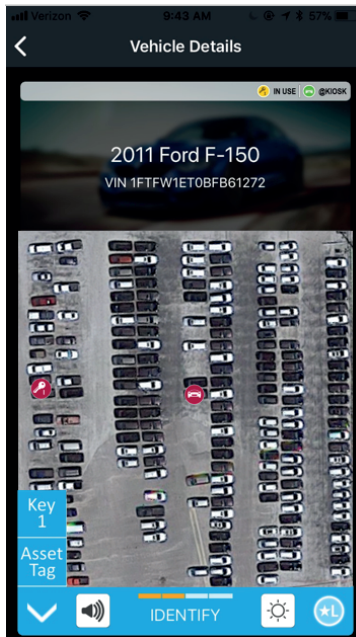

Don't just manage the keys when they are in the spot they should be. It's when they're not that you most need a way to find them.

With goIDit we use wireless sensors that are attached to the keys of the vehicles that are in your inventory. We record the location of the key and uploaded this information to the goIDit cloud service to cross reference the sensor to the VIN, make, model, and year.

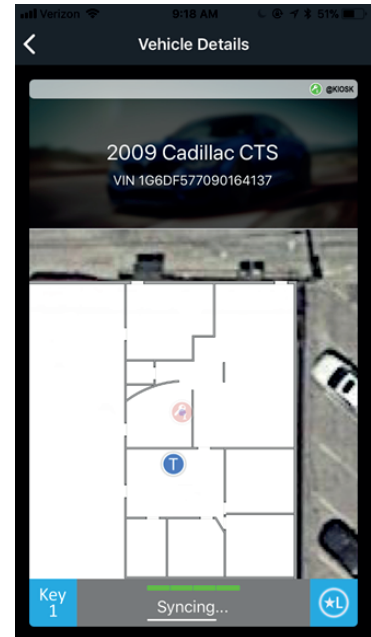

If the key moves, we update it.
If you sell the vehicle, reassign the sensor.
If you need to find a key it's easy even if it's in a drawer.

We automate the way keys are checked out and back in. Users search for a key, locate it, and check it out. Keys also can be checked out to third party vendors . When the key returns to the key area we automatically check it in.

Don't waste time and money finding or replacing missing keys. Get goIDit !

The location of a vehicle and its key is displayed on a map.

The location of a user and a key they are looking for is shown on a floor plan.
